I created a completely fictional website about a tattoo application that displays the top tattoo artists in the country along with their location, social votes and best submitted tattoos for the month. I actually was not planning on creating this type of website but when I was picking out an audio track, I kept coming back to a certain one that was a little darker but still provides enough emotion to be effective. It was this track that got me thinking about what type of website would use something with a dubstep, somewhat dark but not depressing which also includes an ambient feel…tattoo parlor! This led to searching for the perfect jumbotron image that would complement the audio track and provide the initial "feeling" I want the visitor to have when first going to the site.

I've placed all four requirements within the primary menu in order that they are displayed. The first is the HTML5 audio, located in the jumbotron with the background image of the woman getting a tattoo. The second requirement is the interactive data which is just below the jumbotron, displaying a hypothetical social voting system for their favorite tattoo artists. Next we have the interactive map which gives the location of the top tattoo artists along with an image. Lastly we have the image gallery which displays the top chosen tattoos for the month.

Media

Audio track was purchased from Audio Jungle - http://audiojungle.net/item/ambient-agressive-dubstep/5031912 - license for audio is placed in the audio folder of my project.

Jumbotron background-image was purchased from http://bigstockphoto.com

All other images for tattoo artists and photo gallery were taken from Google Images and **all** were filtered using the "labeled for reuse" license.
